TRIPLET[®] SF

Post-Emergent Selective Broadleaf Herbicide

Active Ingredients:

2,4-D, Mecoprop-p and Dicamba

PROFILE

Triplet SF is an effective liquid post-emergent broadleaf herbicide formulation of two phenoxy herbicides and dicamba that selectively controls broadleaf weeds in turfgrass.

ADVANTAGE

Triplet SF is perfect for control of hard-to-kill broadleaf weeds, such as dandelion, clover, henbit and plantains in turfgrasses. Triplet SF is labeled for use on sod farms.

TRIPLET SF FEATURES AND BENEFITS

- Labeled for sod farm usage
- Combination of three powerful selective herbicides
- Effective control of a variety of broadleaf weeds
- Flexibility – higher rates for problem areas, lower rates for turf maintenance
- Ideal for cool or warm season turf
- Get the Optical Advantage[®] – MCP-p is environmentally responsible
- Tank mix compatible with most liquid fertilizers and iron*

THE OPTICAL ADVANTAGE

With the Optical Advantage, Triplet SF is formulated to utilize a purified form of MCP-p, known as the optical isomer. An improved manufacturing process selectively produces the portion of MCP-p that is active as a herbicide, and minimizes the inactive MCP-p. Therefore, the customer receives a final product with virtually the same amount of working MCP-p, and a reduced total load in the environment. All of what you need, less of what you don't – and that's The Optical Advantage[®].

TRIPLET SF PRIMARY USE

- Sod Farms
- Golf Courses
- Lawns
- Turf (Non-Pasture)
- Parks
- Cemeteries
- Roadsides, Rights-of-Way and Other Non-Crop Areas

MODE OF ACTION

The active ingredients for Triplet SF are 2,4-D, MCP-p (Mecoprop-p) and Dicamba. The systemic phenoxyes 2,4-D and MCP-p interfere with the weed's metabolism. The benzoic acid Dicamba also induces cell elongation, curling of leaves, defoliation and, ultimately, elimination of the weed.
